modes: `N` normal `V` visual

Find & move

Reach the thing, then move through the workspace. Leader is `Space`. These are the custom mappings in this Nixvim configuration—not basic Vim motion.

Find anything

N · TELESCOPE

`Space` → `f f`	Find files fuzzy filename search
`Space` → `f g`	Search text live grep across the project
`Space` → `f b`	Find open buffers
`Space` → `f o`	Recent files previously opened paths
`Space` → `f h`	Search help tags

> Inside a Telescope picker, use `C-n` / `C-p` to move, `Enter` to open, and `Esc` to close.

Windows

N

`C-h` `C-j`	Focus left / below
`C-k` `C-l`	Focus above / right
`C-↑` `C-↓`	Shorter / taller resize by 2 rows
`C-←` `C-→`	Narrower / wider resize by 2 columns

Buffers

N

`Shift-h`	Previous buffer
`Shift-l`	Next buffer
`Space` → `b d`	Delete current buffer

Browse the tree

N · NEO-TREE

`Space` → `e`	Toggle file explorer
`Enter`	Open file / expand folder
`a` `d` `r`	Add / delete / rename
`c` `m`	Copy / move choose destination afterward
`R`	Refresh tree
`?`	Show Neo-tree help authoritative list for this view

Jump through code

N · LSP

`g d`	Go to definition
`g r`	Find references
`g I`	Go to implementation capital I
`K`	Hover documentation

> LSP actions only work when a configured server is attached: Lua, Nix, or Rust in this setup.

Recall, don't memorize

N

`Space` → `…`	Pause for Which-key shows available leader continuations
`Space` → `h`	Clear search highlight

`Space` then choose: `f` find `b` buffer `c` code `g` git `x` diagnostics

modes: N normal V visual I insert

Code & review

Act on code, triage problems, and keep editing flow. Context matters: completion mappings apply only while the popup menu is active.

Language actions

N · LSP

Space → c a	Code action fix, import, refactor when offered
Space → r n	Rename symbol project-aware rename
K	Hover docs / type info

Formatting is automatic on save. Lua uses Stylua; Nix uses nixfmt; JS/TS/JSON/YAML/Markdown use Prettier. LSP formatting is the fallback.

Completion popup

I · NVIM-CMP

C-Space	Open completion menu
Tab	Select next item
S-Tab	Select previous item
Enter	Accept selection also selects the first item
C-d C-f	Scroll docs up / down
C-e	Close completion menu

Shape selected text

V

< >	Indent left / right selection stays active
J	Move selection down then reindent
K	Move selection up then reindent

Triage diagnostics

N · TROUBLE

Space → x x	All diagnostics toggle project-wide Trouble list
Space → x d	Current-buffer diagnostics
Enter	Jump to selected item inside the Trouble window
q	Close Trouble window

A useful loop: open buffer diagnostics → jump to an item → ask for a code action → save to format.

Git work

N

Space → g g	Open Lazygit full repository UI
q	Return to Neovim from Lazygit

Gitsigns is always on: changed lines appear in the sign column, and current-line blame is shown automatically. No custom hunk keys are defined.

Comment quickly

N / V · COMMENT.NVIM

g c c	Toggle current line
g c + motion	Toggle by motion for example, gc}
g c	Toggle selection from visual mode

These are Comment.nvim's default mappings; unlike the leader shortcuts, they aren't written explicitly in the Nix keymap list.

Fast working loops

Locate: grep → open hit → definition/references

Sp fg → Enter → g d / g r

Repair: buffer problems → jump → action → save

Sp xd → Enter → Sp ca → :w
